

Quiz Questions

Module 7 | Lesson 7.5 – Custom useQuery and refetch

1. What does React's `useCallback` Hook do?

- A:** `useCallback` accepts a context object returned from `React.createContext` and returns the current context value.
- B:** `useCallback` returns a memoized value from a function call that only gets updated when certain dependencies listed in the Hook changes.
- C:** `useCallback` is an alternative Hook that works exactly like the `useEffect` Hook.
- D:** `useCallback` returns a memoized callback that only changes when certain listed dependencies change.
