### Module 6 | Lesson 6.6 – Deleting a listing

1. Which of the following best describes how the **TData** and **TVariables** type variables behave in the server **fetch()** function we've created?

**A:** TData type checks the variables passed into a request while TVariables shapes the data that is expected to be returned from a request.

**B:** TData shapes the errors object returned from a request while TVariables type checks the query document passed into a request.

**C:** TData shapes the type of data returned from a request while TVariables type checks the variables being passed into a request.

**D:** TData type checks the query document passed into a request while TVariables type checks the variables being passed into a request.

**Answer:** C - TData shapes the type of data returned from a request while TVariables type checks the variables being passed into a request.
