Module 4 | Lesson 4.3 – Connecting the server with MongoDB

1. Which of the following database configuration values were needed to connect our Node server to our Mongo database?

- A: Database username
- B: Database username password
- C: Cluster label
- D: All of the above.

Answer: D - All the above.

2. How were we able to ensure all our GraphQL resolver functions are to have access to the connected database instance?

- A: By importing the connected database instance in all the files where our resolver functions live.
- B: With Apollo server, our GraphQL resolvers can automatically detect the presence of a database object generated by the Node Mongo driver.
- C: By having our database object be available as part of the context object passed to every resolver function.
- D: By introducing our database object as a database value in the `ApolloServer` constructor.

Answer: C - By having our database object be available as part of the context object passed to every resolver function.
