Module 8 | Lesson 8.1 – Creating our Apollo Client

1. The only way we can set up an Apollo client is by using the `apollo-boost` package created by the Apollo team.

A: True
B: False

Answer: B - False

2. What does React Apollo's `<ApolloProvider />` component provide?

A: `<ApolloProvider />` is a higher-order function that creates a new component that has access to React Apollo's Hooks.
B: `<ApolloProvider />` is the component necessary for creating the Apollo client instance.
C: `<ApolloProvider />` helps connect our Apollo client with our React application by making the client available as context everywhere in the component tree.
D: `<ApolloProvider />` uses React's suspense API to help lazy load GraphQL queries made in every component.

Answer: C - `<ApolloProvider />` helps connect our Apollo client with our React application by making the client available as context everywhere in the component tree.
