Quiz Questions

Module 5 | Lesson 5.3 – Create React App – The Rundown

1. What is the following code expected to do?

```
ReactDOM.render(<App />, document.getElementById("root"));
```

A: Render the `<App />` component on the DOM element with the `id` of `root`.
B: Create a new `<App />` component.
C: Replace the component found in `document.getElementById("root")` with the `<App />` component.
D: Create a virtual object representation of the `<App />` component.

2. Which of the following do we need to do to use JSX within TypeScript files.

A: Name our files with the `.tsx` file extension.
B: Have the `jsx` option be enabled in the `tsconfig.json` file.
C: Nothing. TypeScript supports JSX right out of the box.
D: Both A & B.

3. Which application dependency do the scripts of our **create-react-app** project depend on?

A: `react-dom`
B: `react`
C: `react-scripts`
D: `jest`

4. When a **create-react-app** project is ejected, we're always able to revert to the original project configuration.

A: True
B: False
