# Quiz Questions

## Module 7 | Lesson 7.7 – Custom useMutation Hook

### 1. In TypeScript, what is the type used to describe arrays with a fixed number of elements whose types are known?

**A**: Array
**B**: Tuple
**C**: Enum
**D**: Void

### 2. What does our custom `useMutation` Hook do when used in a component?

**A**: It makes a GraphQL mutation when the component mounts and returns an object that contains details about the mutation result.
**B**: It makes a GraphQL mutation when the component un-mounts.
**C**: It returns an array of two values, the first being a function when triggered makes the request and the second being an object that contains detail of the request.
**D**: It returns an array of four values - the request function, the data from a successful request, the loading state of the request, and an errors object from a failed request.
