Quiz Questions

Module 7 | Lesson 7.6 – Custom useQuery and loading/error states

1. The `loading` value returned from our custom `useQuery` hook helps indicate when a query request is in flight.

A: True
B: False

2. How does GraphQL return errors from a request?

A: Errors generated from a request is returned in an `errors` field in the response.
B: Errors generated from a request is kept in an `errors` property within the returned `data` response field.
C: GraphQL does not allow the return of any error information.
D: Errors generated from a request is returned in an `dataErrors` field in the response.
